Week 1 Report

AI-Powered Instagram Influencer Analytics & Automation Insights Internship

SR NEXT Self-Guided Internship Program

Student Information

Name: SHRE RAAM P J

Role: Independent Intern / Project Contributor

Phase: Phase 1 – Week 1

Mode: Remote / Self-Guided

Objective

The objective of Phase 1 was to collect and structure a large-scale Instagram influencer dataset containing influencers and Instagram pages with follower counts below 1 million. The dataset was prepared for future AI/ML analysis and ranking tasks in Phase 2.

Work Completed

During Week 1, a structured influencer dataset was created containing:

- Instagram usernames / handles
- Follower counts
- Categories / niches
- Engagement rate estimates
- Contact information (if publicly available)
- Posting frequency
- Hashtags / content themes
- Additional notes

The dataset was cleaned, organized, and formatted in Excel/CSV format for future analysis.

Process & Workflow

1. Influencer Discovery

Multiple influencer discovery methods were used to identify Instagram accounts with follower counts between 2K and 1M.

Tools Used:

- Heepsy
- Instagram search & suggested accounts
- Public Instagram pages

Heepsy was mainly used to identify influencer accounts and obtain niche/category and location-related filtering information.

2. AI-Assisted Username Collection

After discovering profiles using Heepsy and Instagram exploration:

- prompts were provided to AI tools such as:
 - HypeAgent AI
 - ChatGPT
 - Claude

These AI tools helped generate structured influencer username lists and organize discovered profiles efficiently.

3. Verification Using Apify

The collected usernames were then verified using Apify scraping tools.

Data extracted using Apify:

- Instagram username
- Followers count

- Bio details
- Public profile information

Screenshots and extracted outputs were used for further structured processing.

4. Structured Data Generation

The verified usernames and extracted profile information were then processed using AI tools such as:

- ChatGPT
- Claude

These tools were used to generate and organize:

- category/niche
- posting frequency estimates
- hashtags/content themes
- engagement rate estimates
- additional notes
- contact details (if publicly available)

The generated outputs were manually reviewed before adding them into Excel.

5. Data Cleaning & Preprocessing

The dataset underwent multiple manual cleaning steps:

Cleaning Tasks Performed:

- Removed duplicate usernames
- Fixed merged cells
- Standardized formatting
- Sorted records
- Corrected inconsistent entries
- Organized columns uniformly

Excel and Google Sheets were used extensively during this process.

Tools & Technologies Used

Tool	Purpose
Heepsy	Influencer discovery & filtering
Apify	Instagram data extraction & verification
ChatGPT	Data structuring & field generation
Claude AI	Structured formatting assistance
Excel	Dataset organization & cleaning
Google Sheets	Data management & preprocessing

Skills Learned

During Week 1, the following practical skills were developed:

- Large-scale data collection
- Data cleaning and preprocessing
- Spreadsheet management
- Duplicate handling
- Structured dataset creation
- AI-assisted workflow optimization
- Influencer data analysis basics
- Automation-assisted research methods

Challenges Faced

Some challenges encountered during Week 1 included:

- Duplicate profile entries
- Merged cell formatting issues
- Inconsistent influencer data
- Missing contact information
- Time management while scaling data collection
- Balancing data quality and speed

These issues were resolved through manual verification, structured workflows, and batch-based processing methods.

Current Progress

By the end of Week 1:

- Hundreds of cleaned influencer records were successfully collected and structured
 - A scalable workflow for future data collection was established
 - The dataset was prepared for further preprocessing and AI/ML analysis in Phase 2
-

Conclusion

Week 1 focused on building a scalable and structured influencer dataset using a combination of AI tools, scraping platforms, and manual verification techniques. The work completed during this phase established a strong foundation for Phase 2, where AI/ML-based analysis, ranking, and visualization of influencer data will be performed.
